

Joshua Robinson

This summer, I am completing an internship with the AnnieRuth Foundation. My career aspiration is to be a computer engineer. To help me see what it is like to be an engineer. The place I am doing this summer internship is called Jacobs engineering. Jacobs engineering is located at downtown Jacksonville in the Truist Bank building. Since working there, I have completely tasks under my mentors Mrs. Jaynelle Pemberton and Mrs. Sherri McElfresh. They are both very kind and welcoming. They made my time at Jacobs worth it more than anything.

I have learned things at Jacobs as well. It may not be top tier engineering knowledge, but it is something. My first week there I disassembled a load of desktops and took out their hard drives. It was hard at first, and confusing. There were a lot of parts inside the computer that looked alike. After I got my first one though, the rest was easy. So if someone ever needs me to take out and replace a hard drive for a laptop or computer, I can do it.

It was very smart to join the AnnieRuth foundation. In this program, we have learned what it means to be leaders, and how to apply each lesson we were taught to the real world. I enjoyed learning something new every month and even recommended it to a few classmates at school. It also help me actually Pursue my career aspiration instead of just saying I will do it one day. This was very helpful, and allowed me to reach further out in my journey, giving me a head start over the competition.
